COLD STORAGE

• Private keys are created using a software program on a computer.

• Private keys can be stolen by hackers if the computer is online.

• Private keys with a limited amount of value can be stored in an online environment to minimise the security risk.

• Private keys should therefore be created and stored in a secure offline environment.

• This secure offline environment is called a cold storage.

• A few cold storage methods are: USB drive, paper wallet or hardware wallet.
